# PET is great because...

- ...it has high biological specificity
- ...its targets are limited only by physics and the imagination of the radiochemists
- ...unlike MRI, it provides truly quantitative measurements

# Why conventional PET sucks?

**A) Linear lines of response**

**B) Angular lines of response**

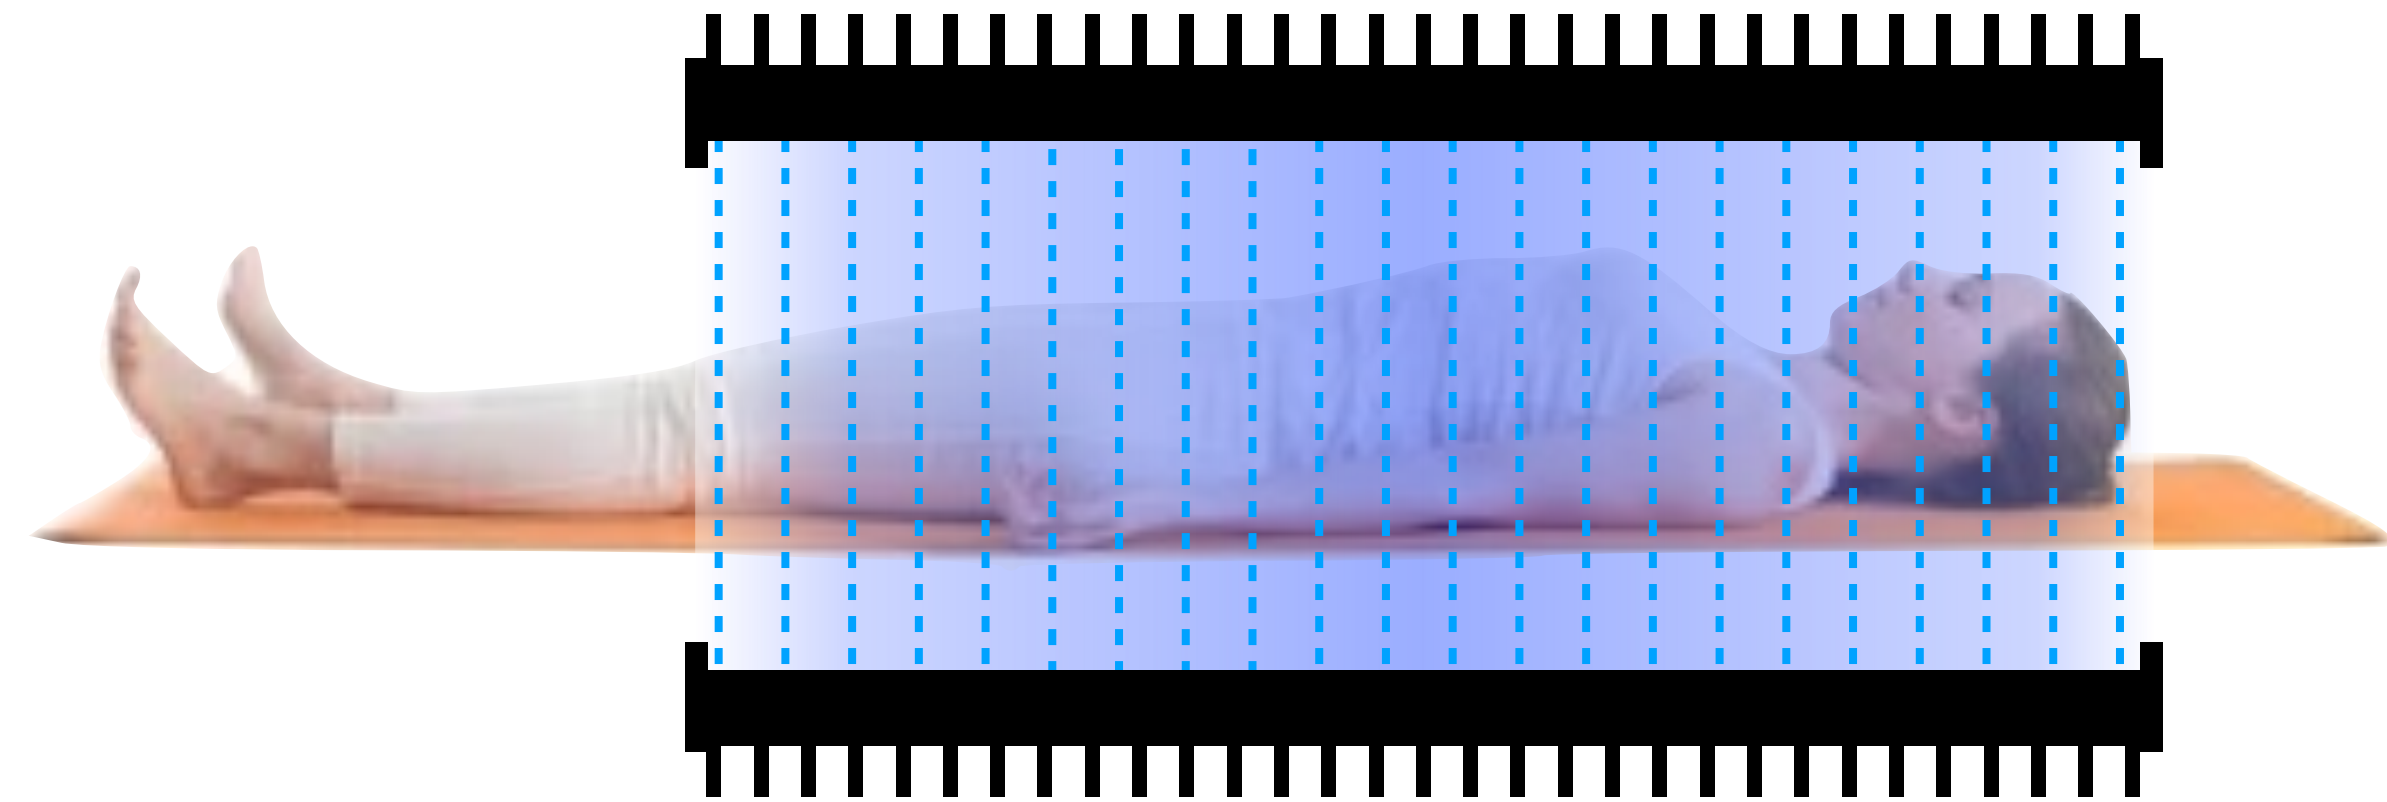

**A) Conventional PET:** linear lines of response

**B) Conventional PET:** angular lines of response

**C) Total-body-PET:** linear lines of response

**D) Total-body-PET:** angular lines of response

# Improving the SNR

- **Siemens Quadra** scanner can pick up ~24 times more gamma counts than conventional PET-CT
- **SNR** of a reconstructed PET scan is  $\sqrt{N}$  where N is the number of events
- **Event detection** depends on sensitivity (S), injected activity (A) and imaging time (T) scaled by constant (k), thus  $SNR = k \times \sqrt{S \times A \times T}$

# What to do with the increased sensitivity

- **Increase SNR by a factor of  $\sqrt{24} = 4.9$**  while keeping the protocol otherwise fixed
- **Reduce imaging times with a factor of 24,**
  - Routine 24-minute [18F]FDG scan could be accomplished in just one minute.
  - Significantly increases patient throughput and comfort, which decreases subject motion, further improving image quality.
- **Image-based input** can be routinely used (e.g. carotid artery) as it will be most likely in the imaging —> reduced workload

# What to do with the increased sensitivity

- **Reduce the injected activity by a factor of 24.**
  - Typical whole-body [ $^{18}\text{F}$ ]FDG scan requiring ~480 MBq injected activity  
—> now injection 20 MBq —> effective doses < 0.3 mSv.
- **Up to 40 consecutive scans** with the same effective dose that is currently received from a single scan,
- **Permits multi-injection activation studies** with short-lived radiotracers ( $^{15}\text{O}_2$ ), longitudinal studies with more datapoints, or multi-ligand studies
- **Routine whole-body imaging** allows diagnosis of conditions outside main target region

**256 MBq**  
injected  
activity  
( $^{18}\text{F}$ -FDG)
