

MODEL-FREE ANALYSIS OF FMRI

Turku PET Centre Brain Imaging Course 2024

Severi Santavirta, Turku PET Centre

Features of model-based analyses

- Require hypotheses
 - What do we now and expect to happen in the brain?
- Estimation of haemodynamic response function
 - What does the brain response look like?
 - Unlikely similar in all brain areas
- Interpretational difficulties with complex models
 - Did we answer to this question with this model?
- A ton of researcher degrees of freedom
 - Replicability of the findings?

Model-free analysis techniques

Blind signal separation

- Independent component analysis (ICA) & principal component analysis (PCA)

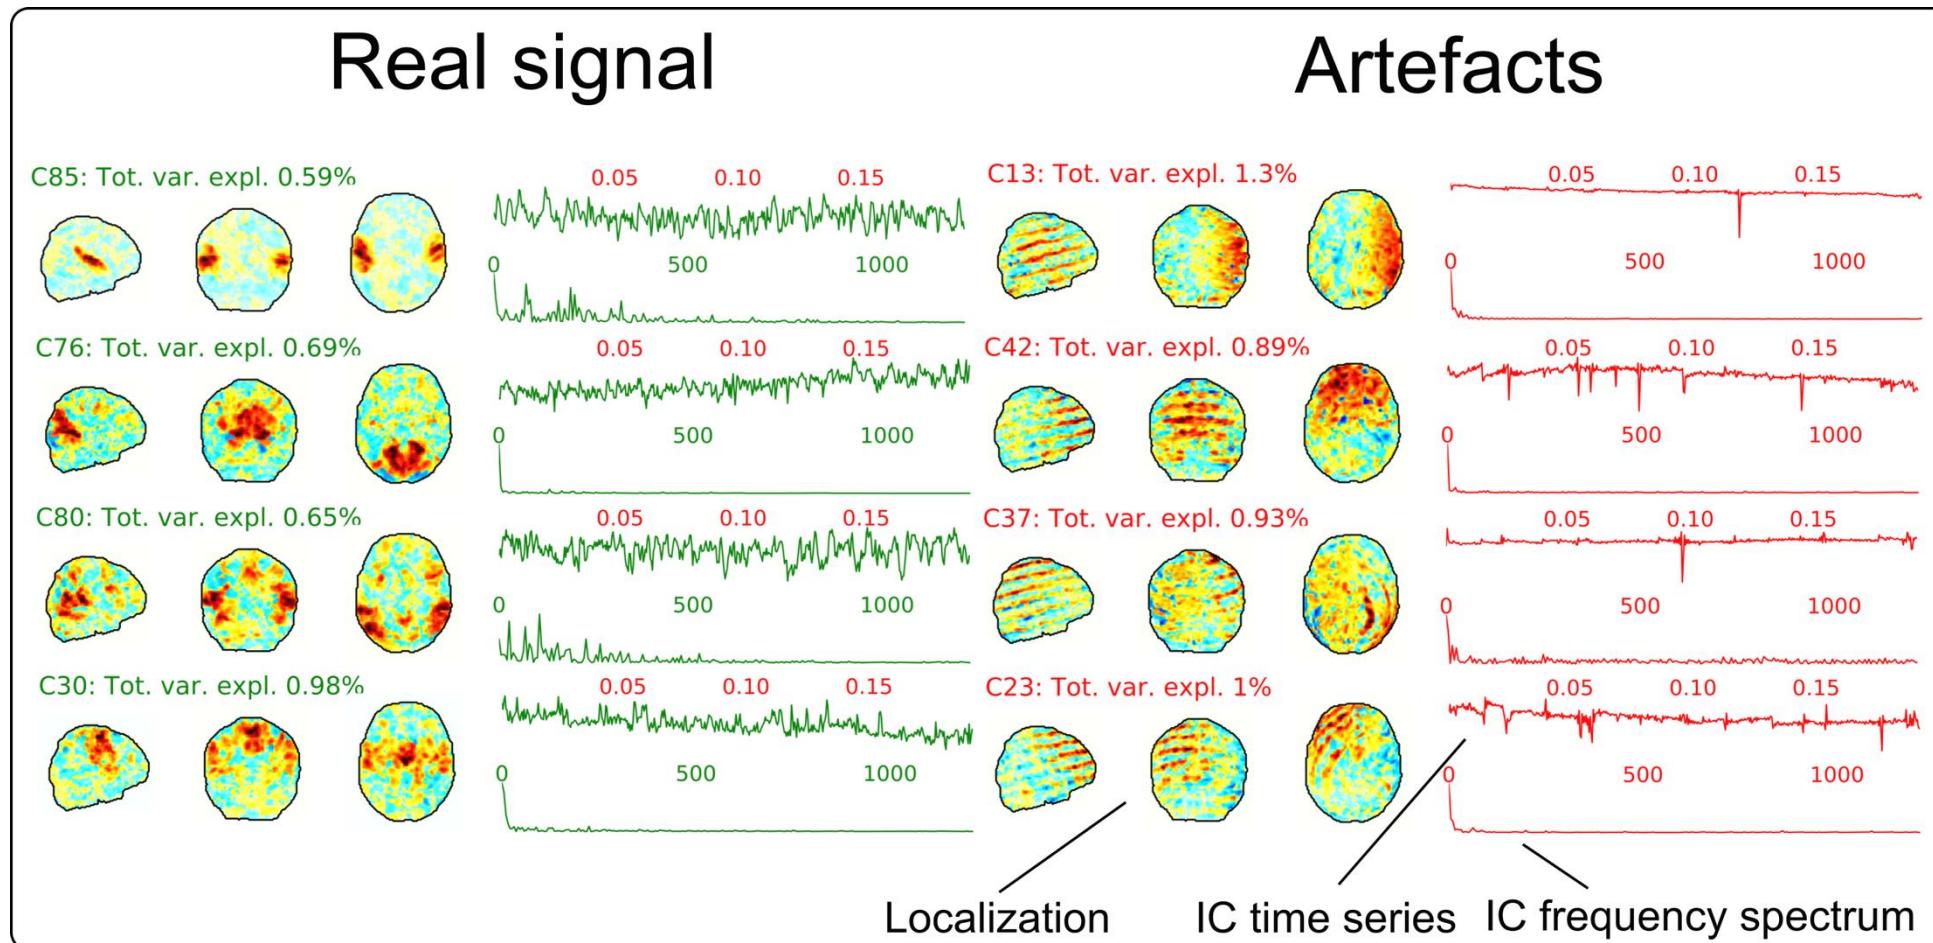

Synchronization analyses

- Intersubject correlation analysis (ISC)
- Time-window ISC analysis
- Intersubject phase synchronisation analysis (ISPS)
- Intersubject functional connectivity analysis (ISFC)

Blind signal separation

- **Motivation:** To extract different or mutual sources of information from a set of variables without prior knowledge
- **Input data**
 - Audio signals from different microphones
 - fMRI signals from different voxels / brain areas
- **Independent component analysis (ICA)**
 - Finds independent sources of information
 - Separates two different speakers from mixed audio signals
- **Principal component analysis (PCA)**
 - Finds uncorrelated components that explain the mutual variance of the source signals
 - Finds shared components between two speakers, audio intensity, for example

Independent component analysis (ICA)

(Pruim, 2015)

Topics

Basic concept of
intersubject synchrony
of brain activation

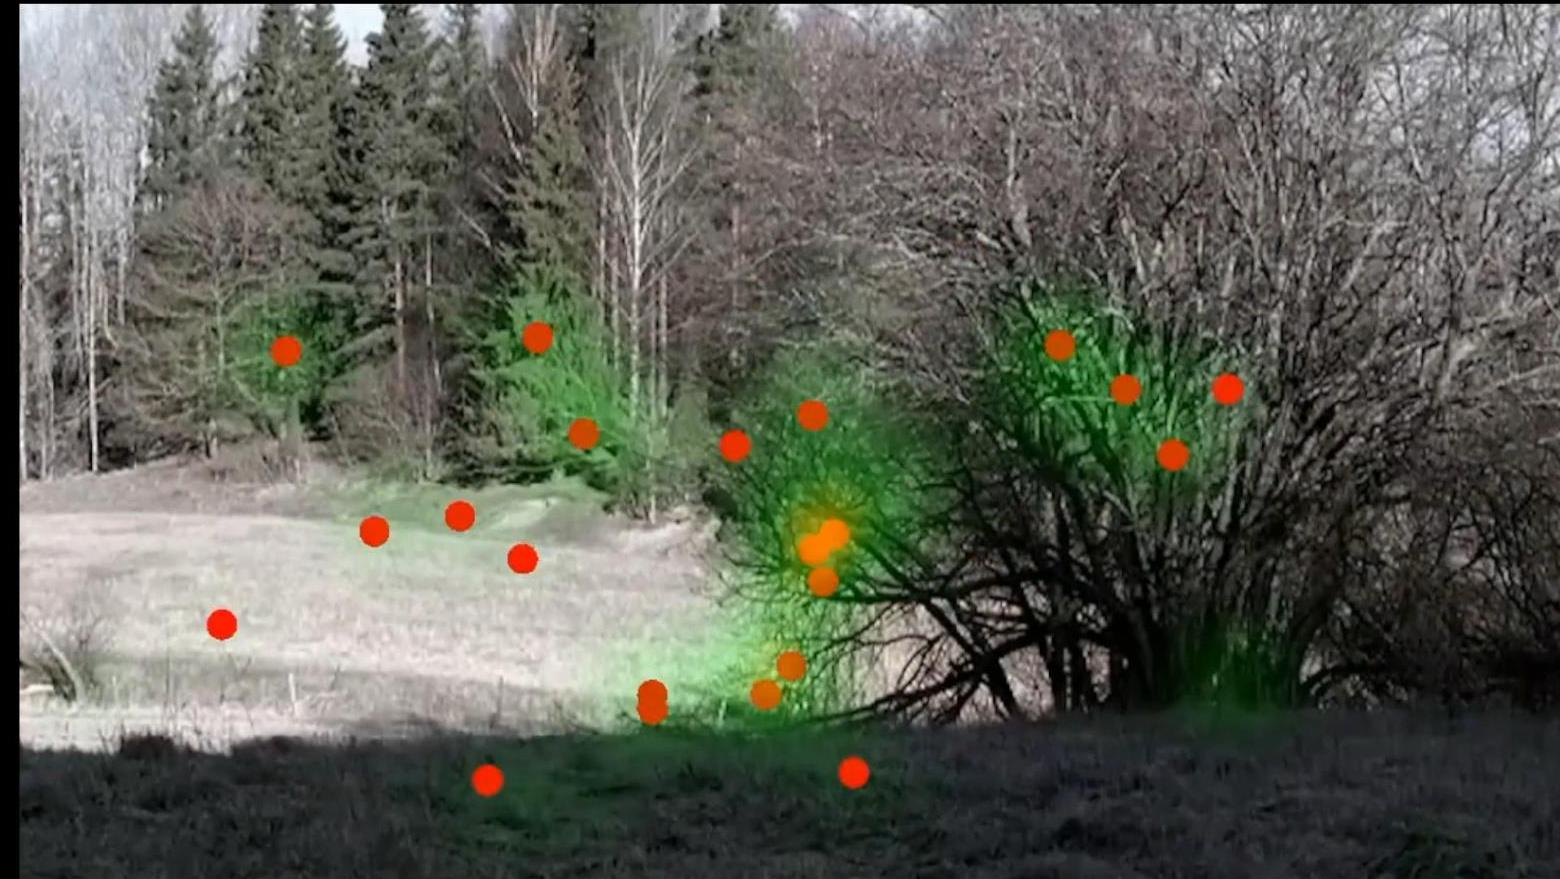

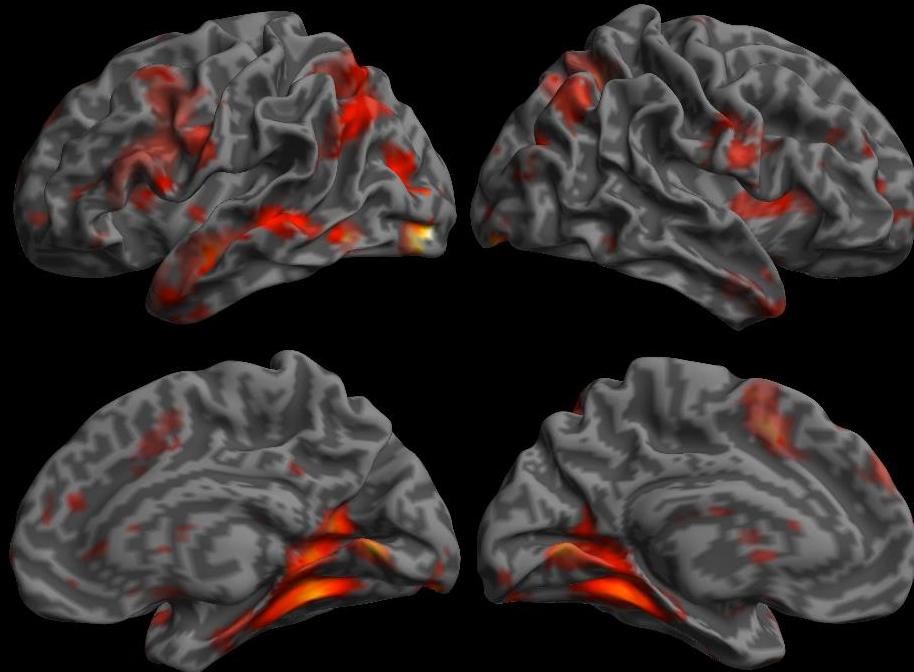

Methods to measure
intersubject synchrony

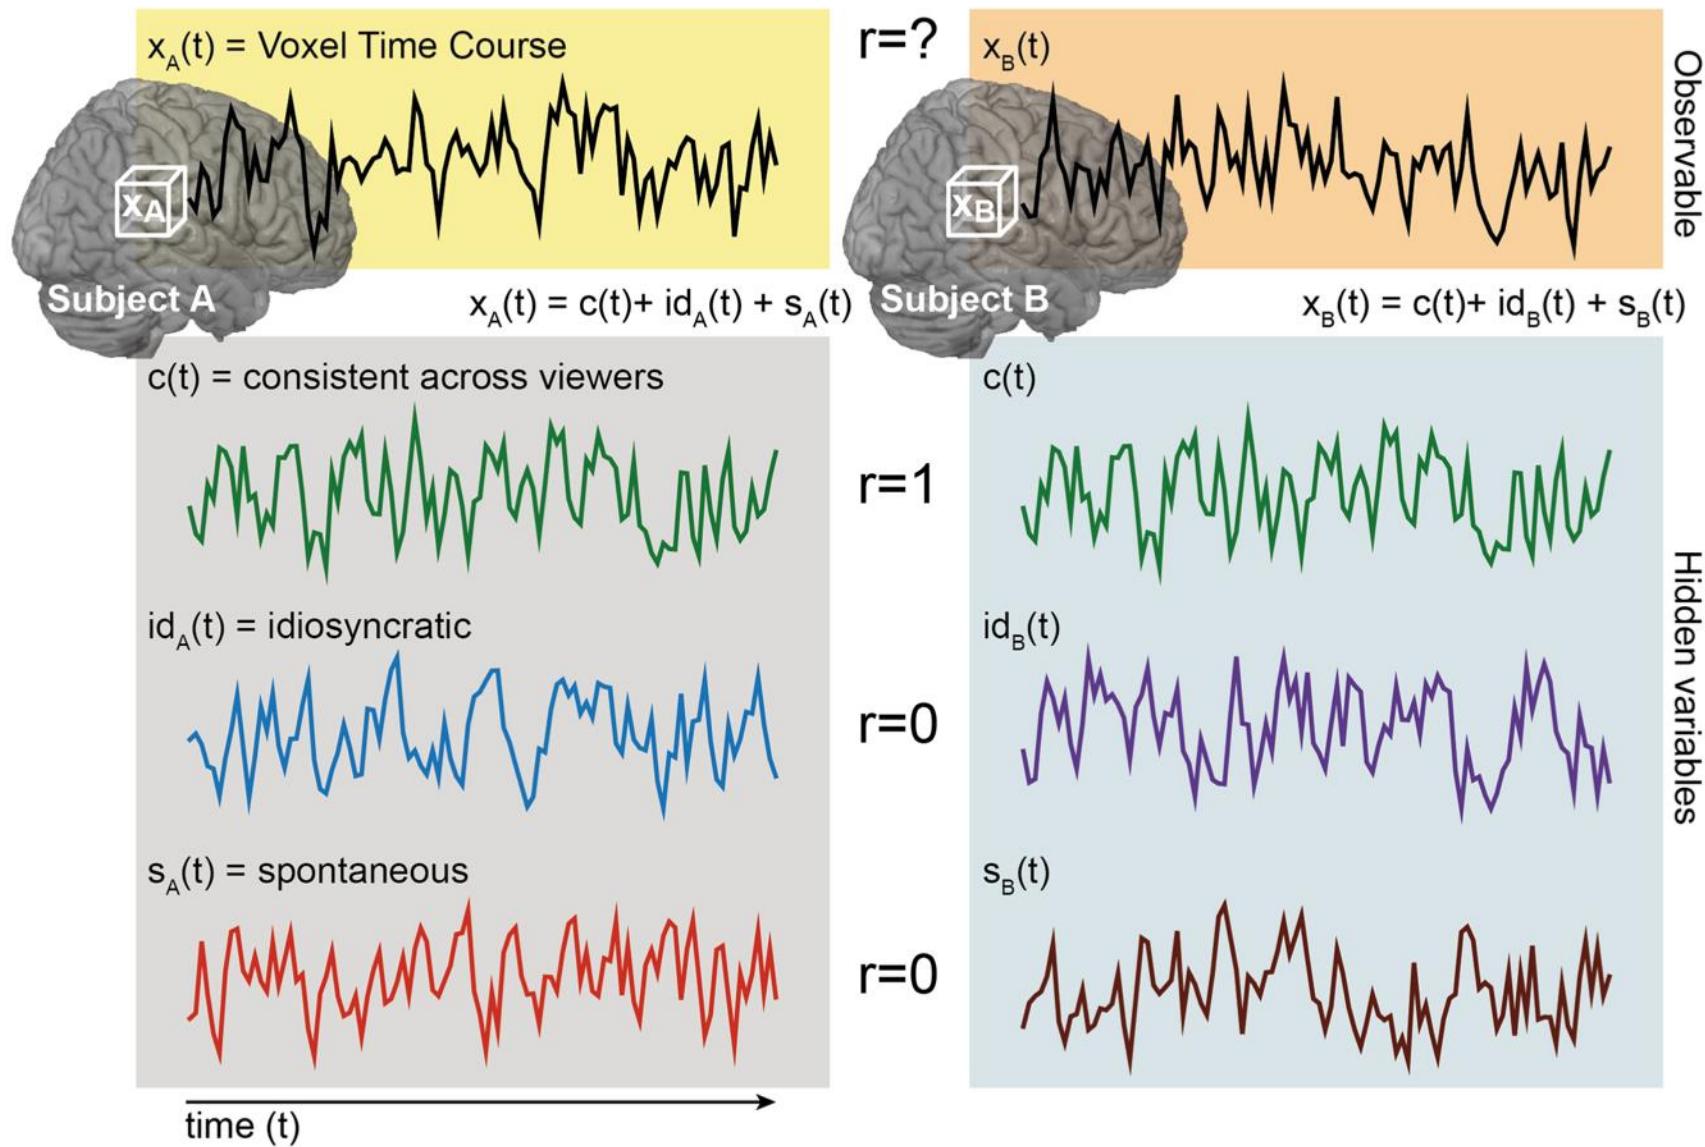

Statistical testing in
synchronization
analyses

ISC toolbox for ISC
analysis

Films induce consistent brain activation across subjects

(Hasson, Nir, Levy, Fuhrmann, & Malach, 2004)

(Nastase, 2019)

Benefits of measuring synchrony

synchrony
vs.
hemodynamic (de)activation

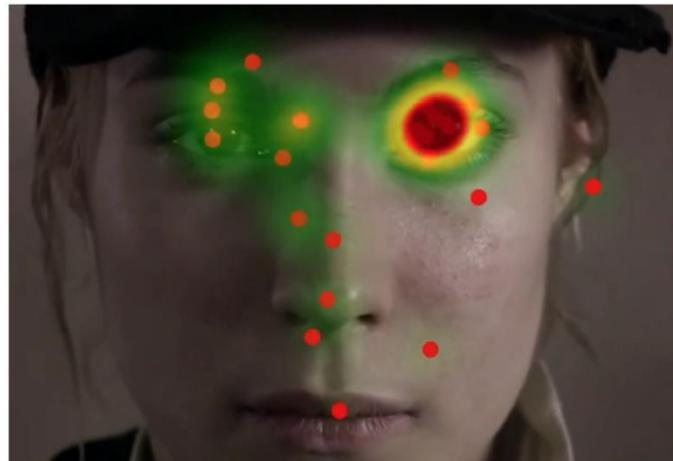

No need for detailed hypothesis/models

Easy to use complex stimuli

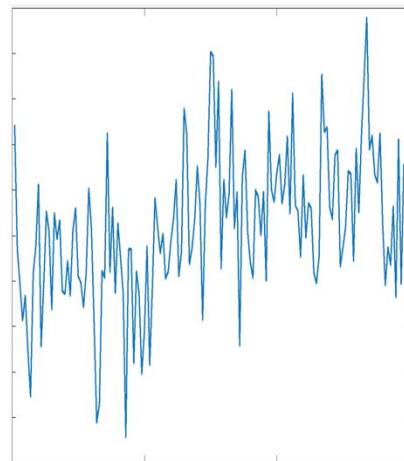

-> Simple designs
better replicability?

Capture shared stimulus dependent signal

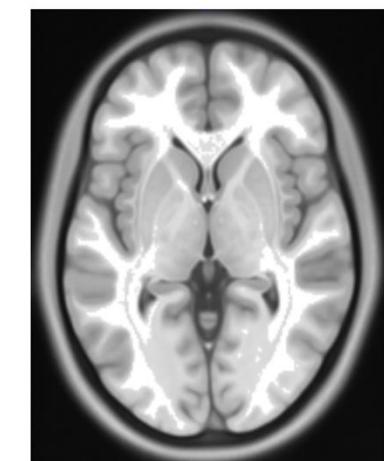

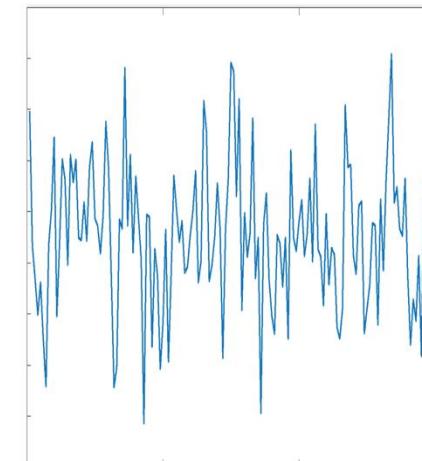

Pre-requirements for synchronization analysis

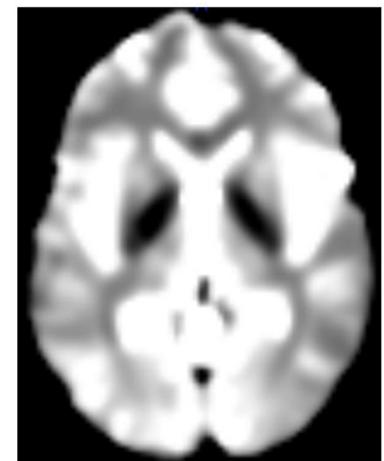

Shared stimulus

High-pass filtering
(detrending)

Spatial normalization

Smoothing

Shared stimulus

- 1) Exactly the same stimulus, e.g. a movie
- 2) Semantically shared stimulus, e.g. different movies but with synchronous emotional context

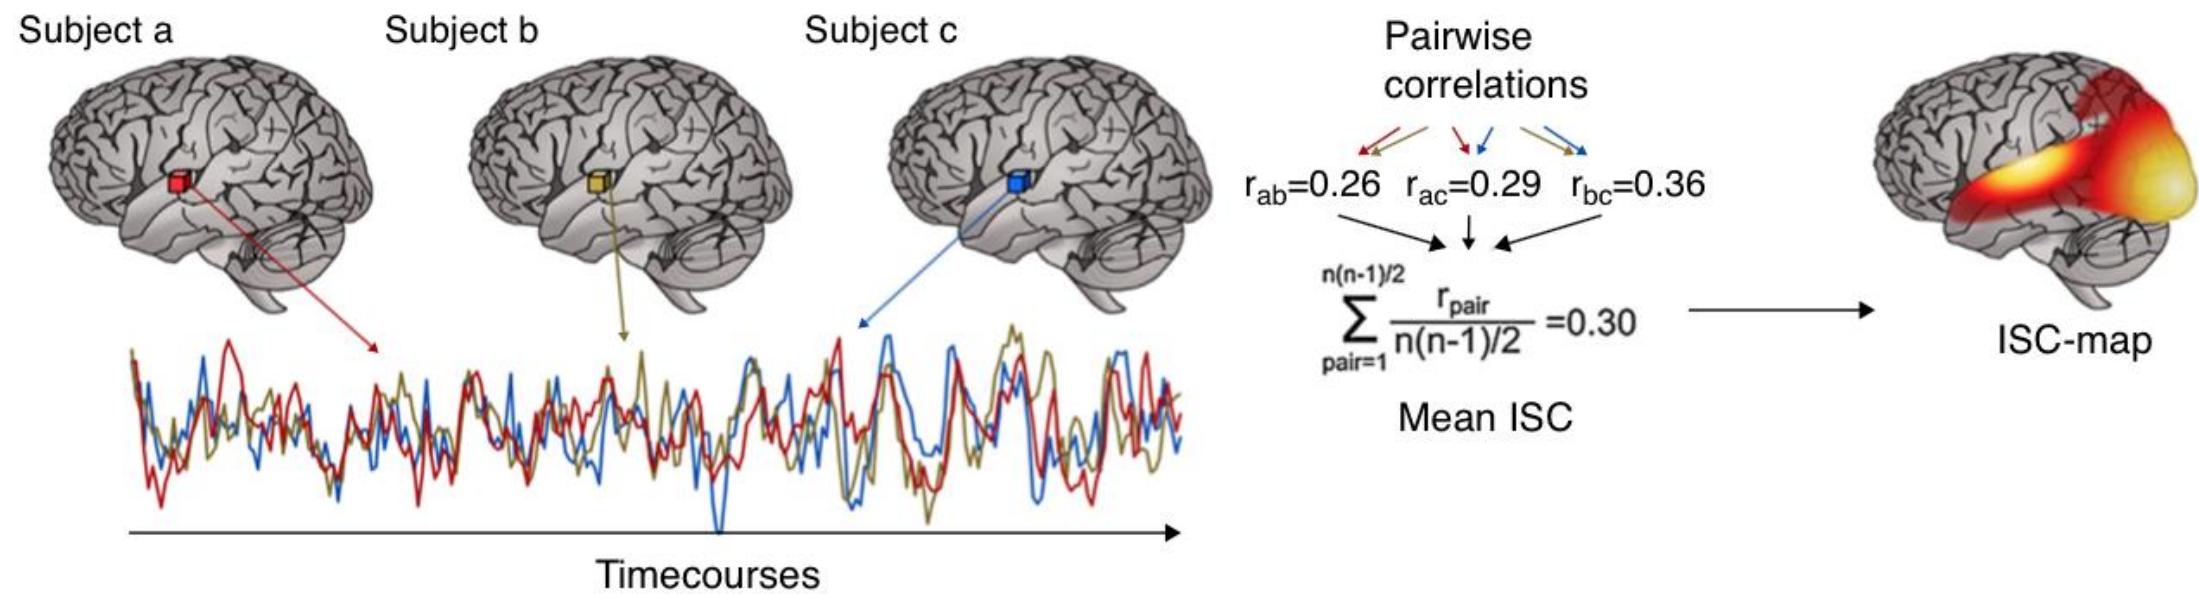

Intersubject correlation analyses

Measure	Time scale of the measured synchrony
ISC	Over the whole experiment (minutes-hours)
Time-window ISC	Specified time-windows (15sec - minutes)
ISPS	Instantaneous (seconds)

Shorter time scale

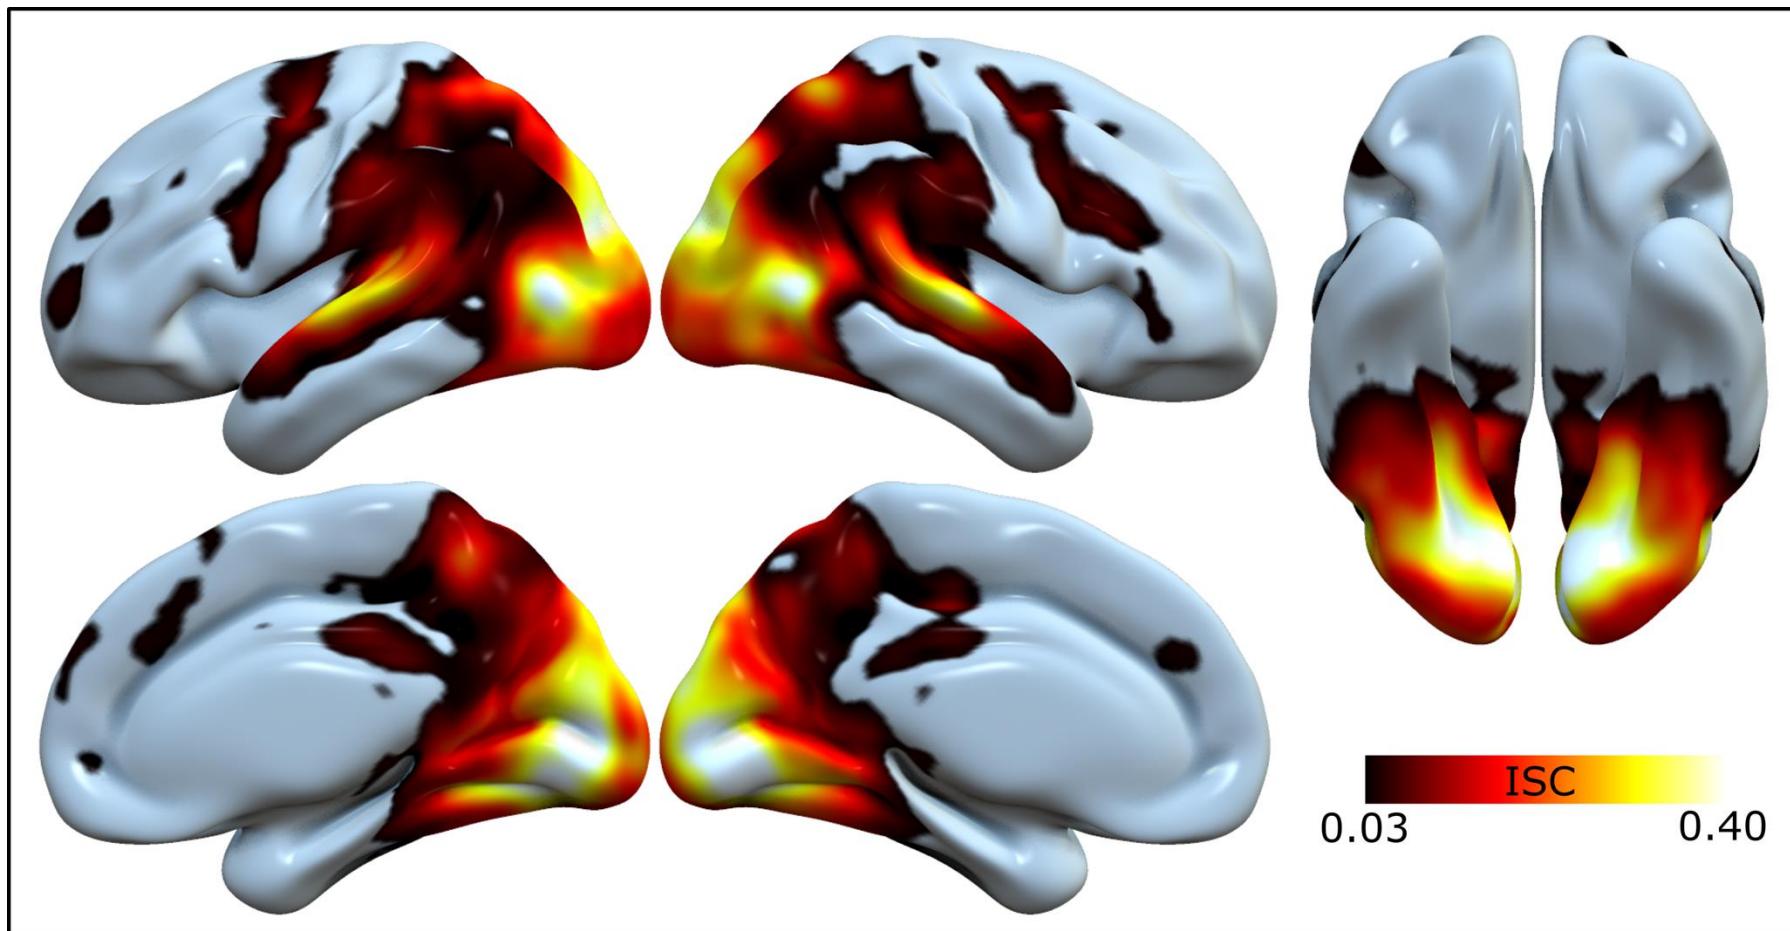

Basic concept of intersubject correlation (ISC)

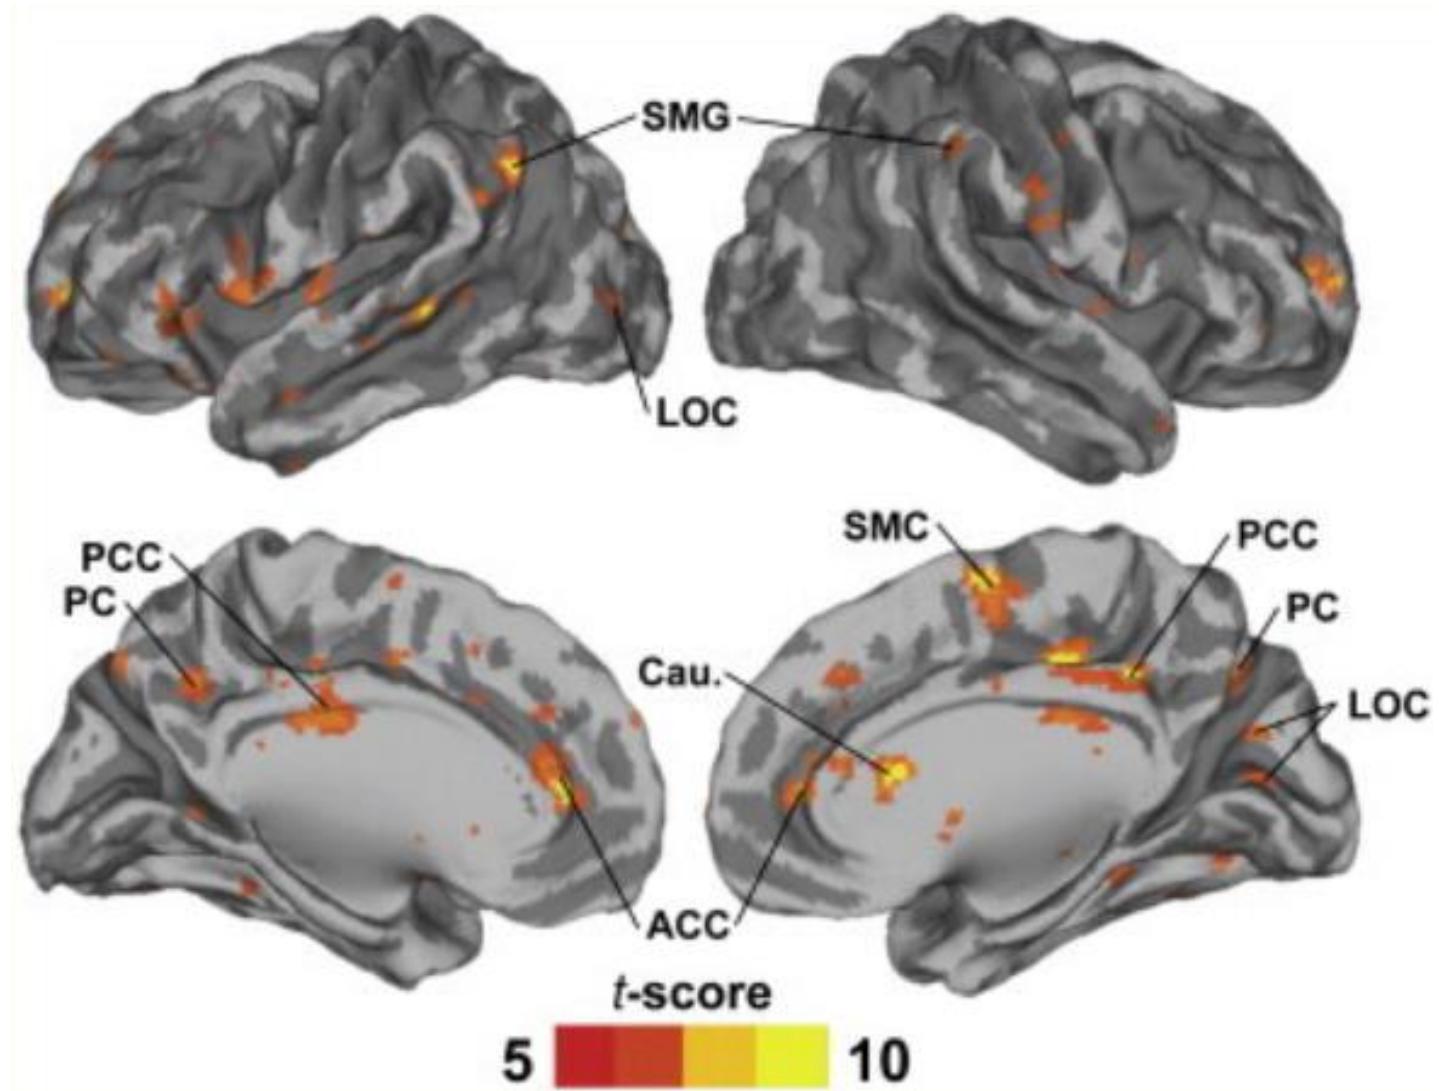

(Nummenmaa, 2018)

Typical ISC in movie experiments

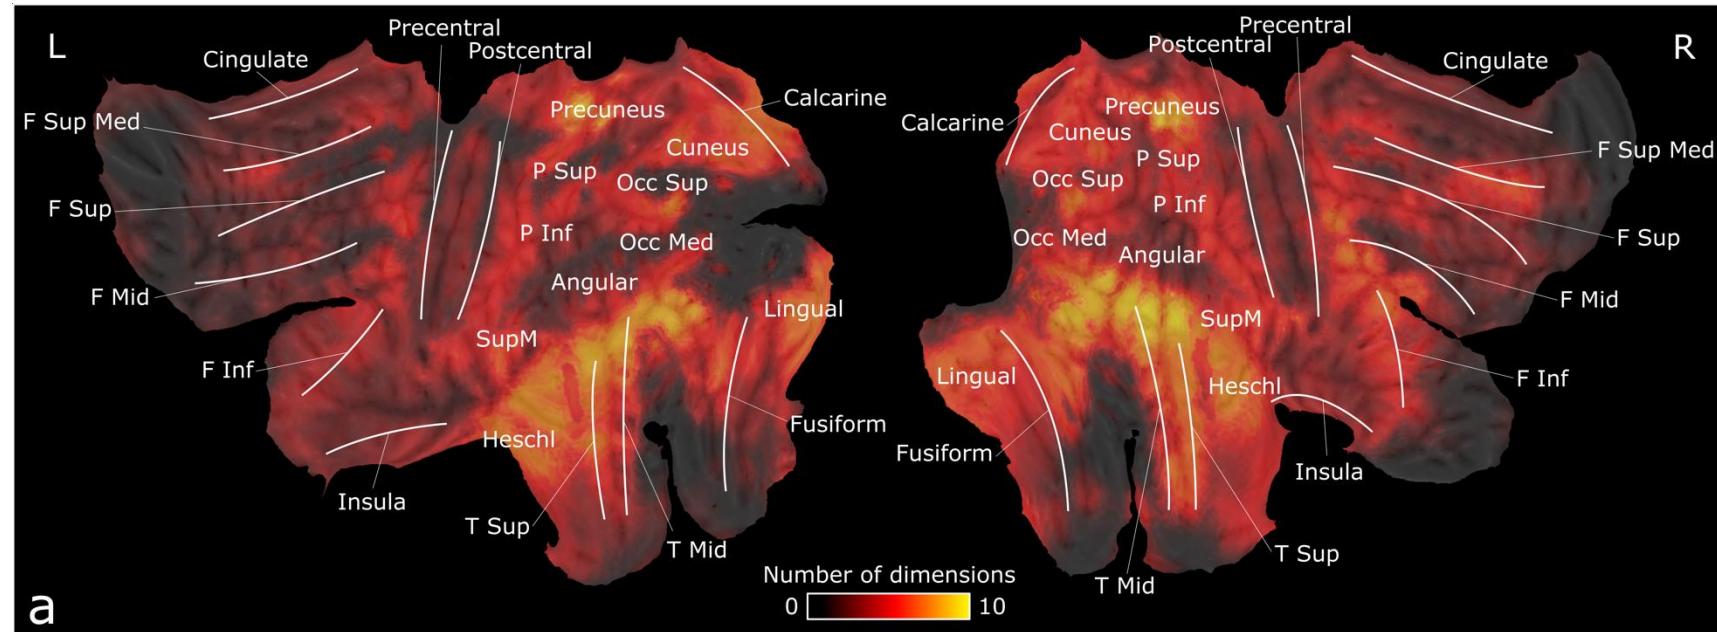

Decreased
ISC in autism
spectrum
disorders

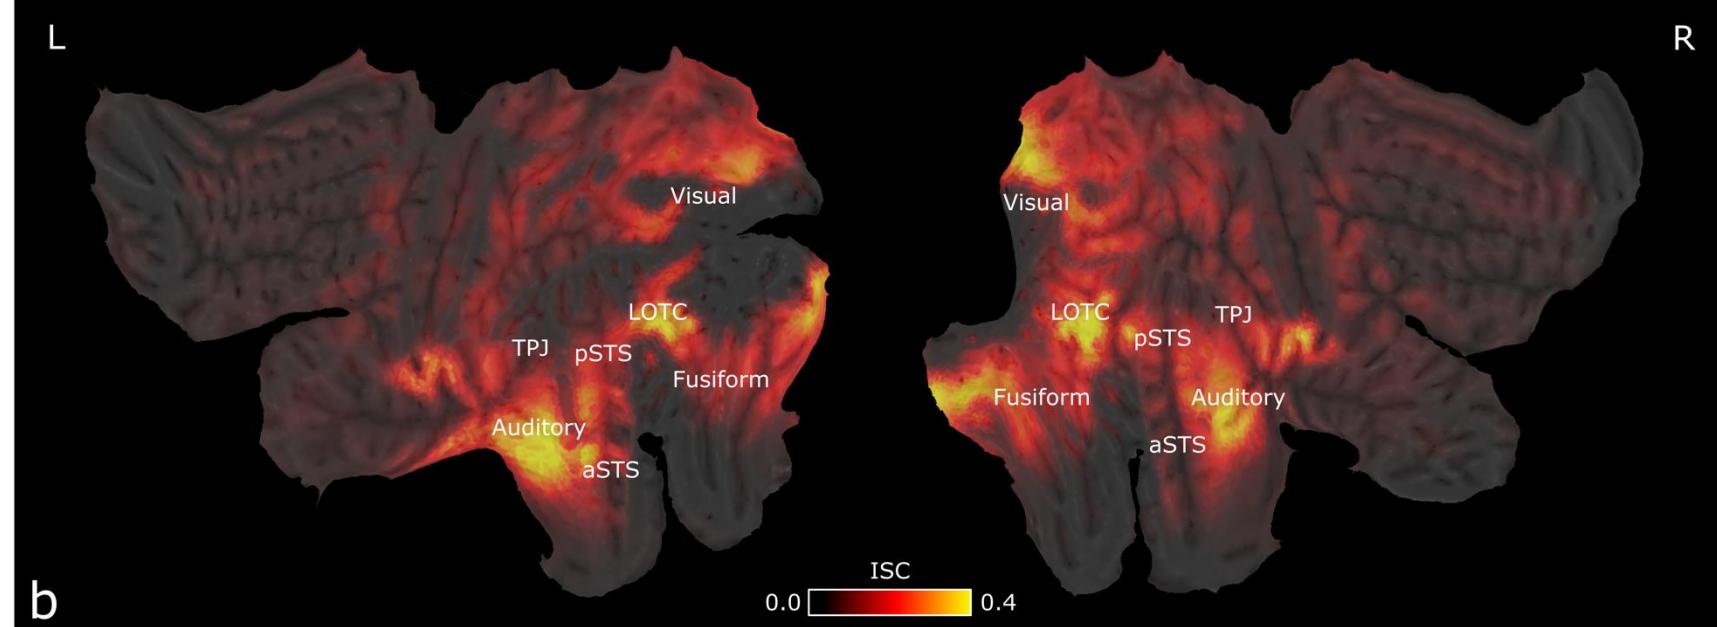

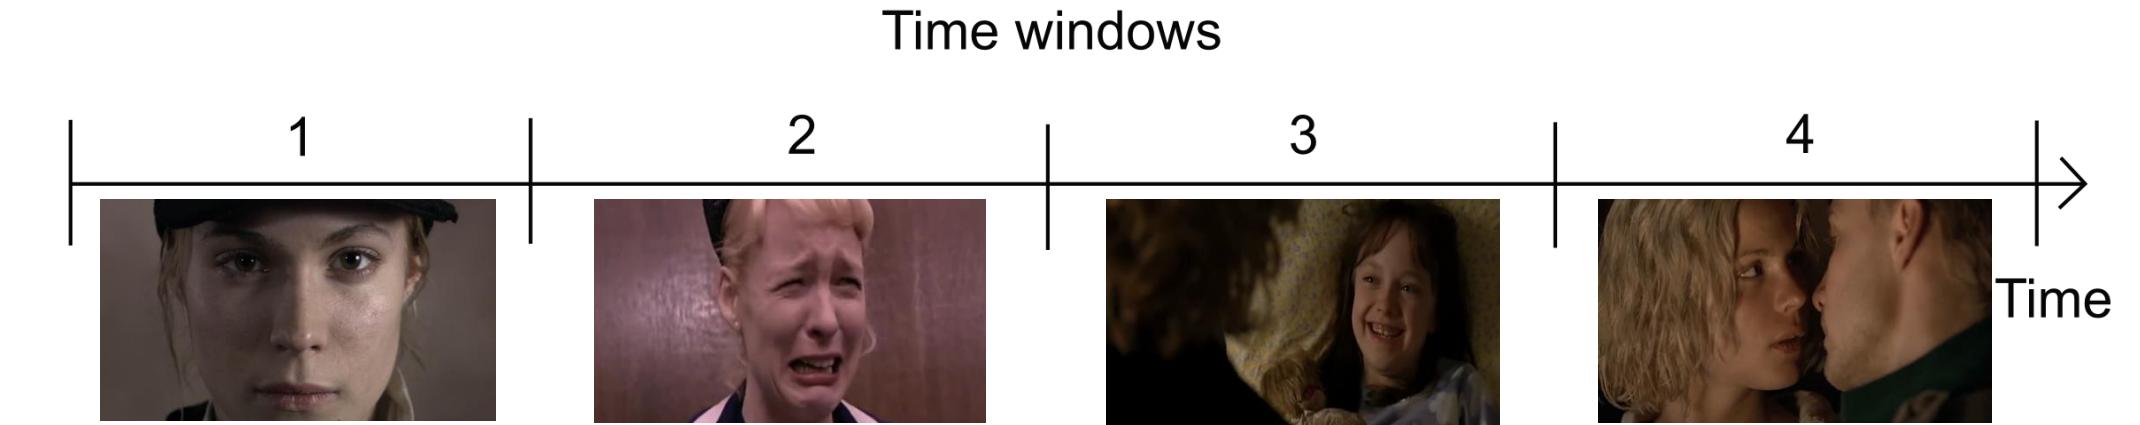

(Salmi, 2013)

Brain areas activated in social information processing

Average ISC of brain activation

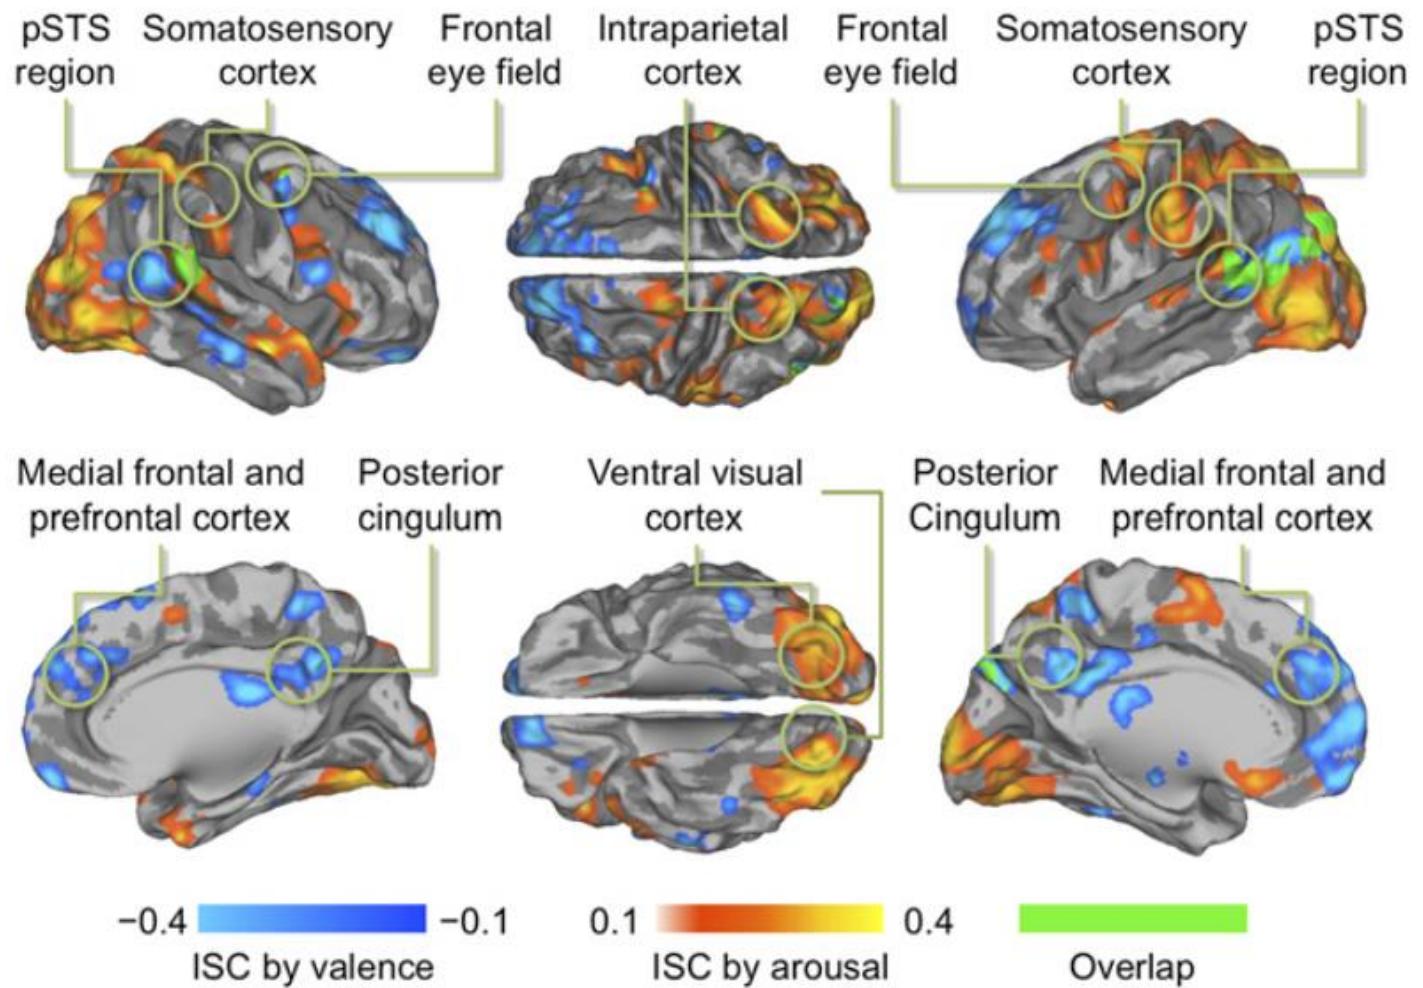

Time window ISC

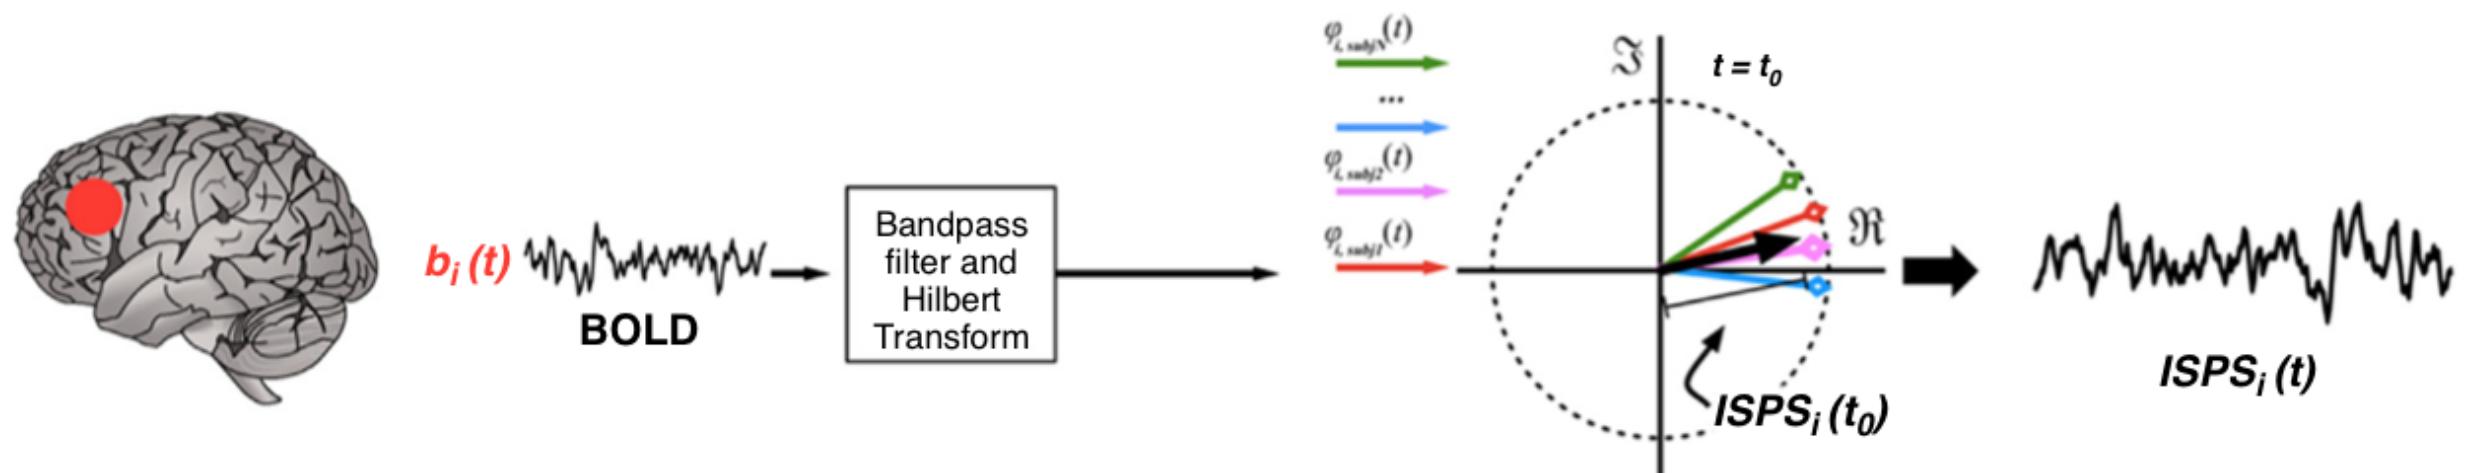

- Dynamic measure of intersubject synchrony
- Sliding window approach
 - Reflects the moving average of ISC
 - How to choose the window length?

Valence and
arousal
predict time-
window ISC

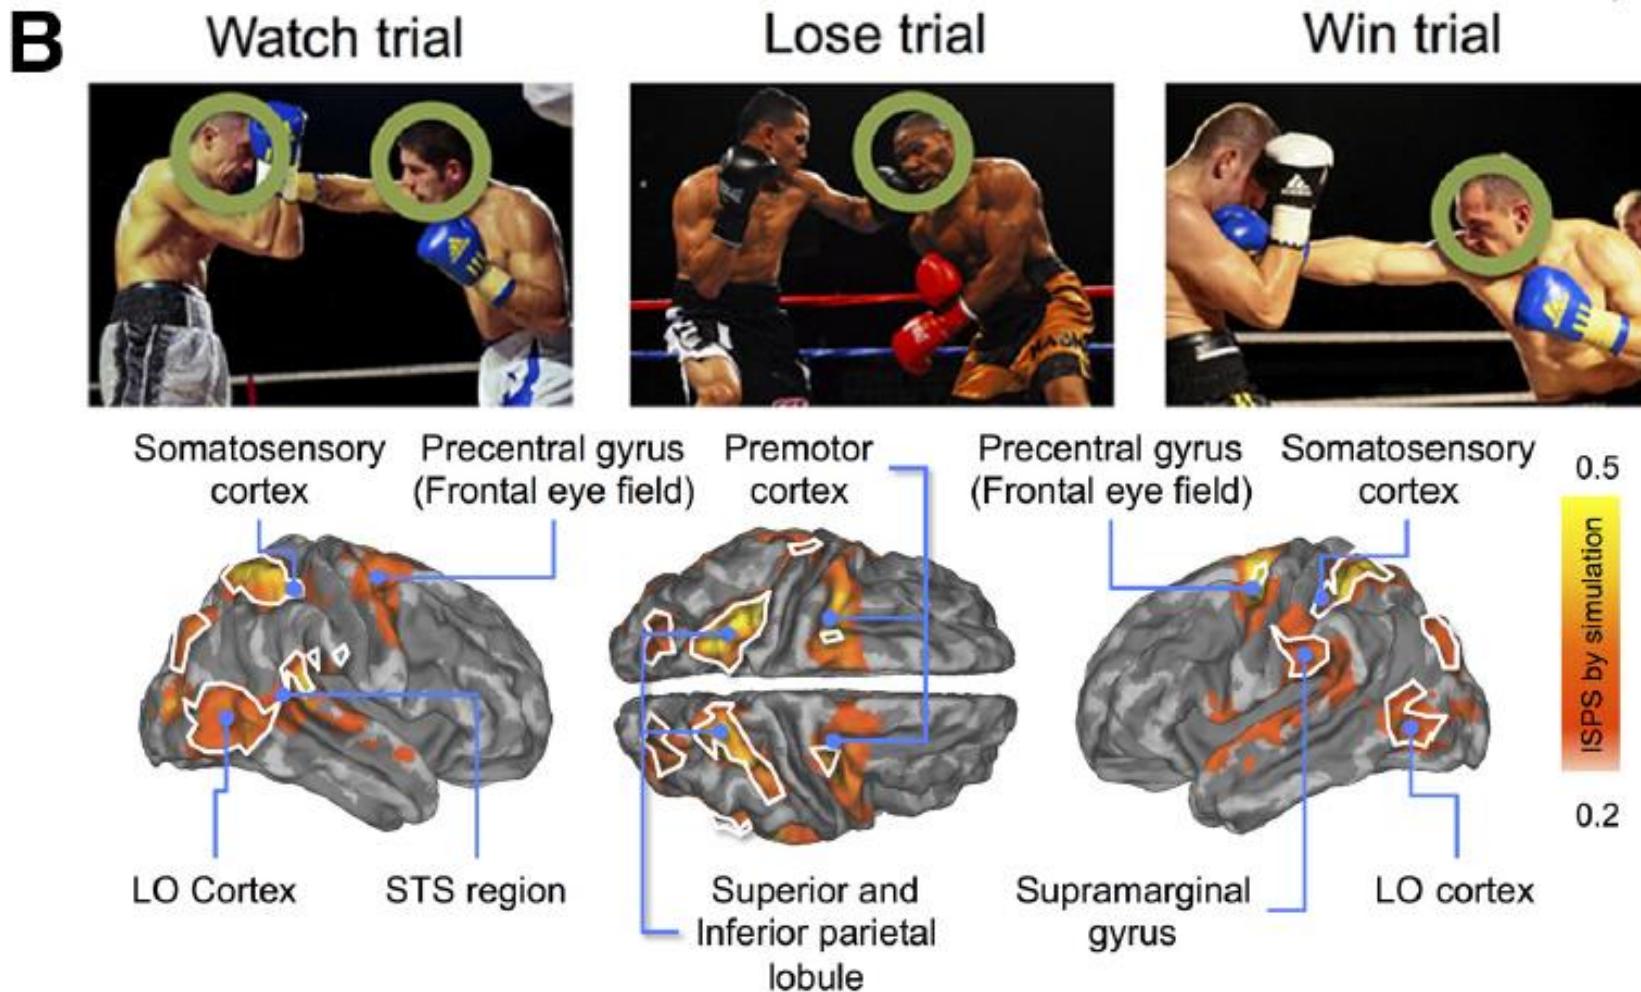

(Nummenmaa, 2012)

Intersubject phase synchronization (ISPS)

(Nummenmaa, 2018)
(Glerean, 2012)

ISPS in perspective taking vs. passive watching

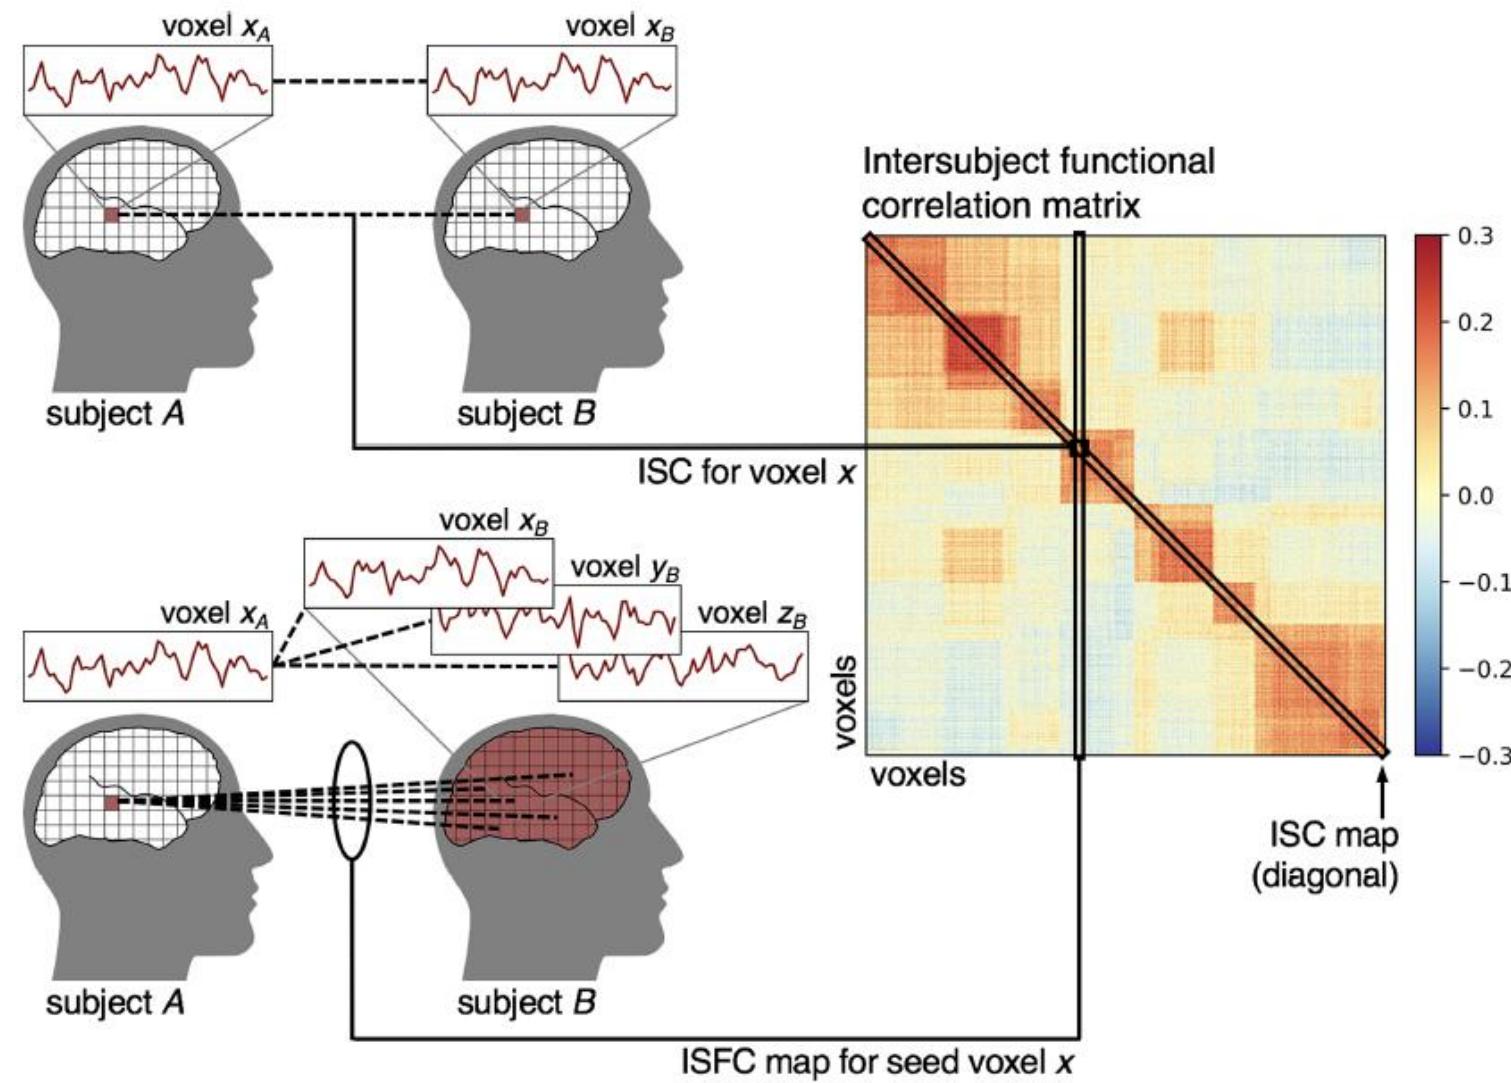

(Nummenmaa, 2014)

Reverse correlation approach

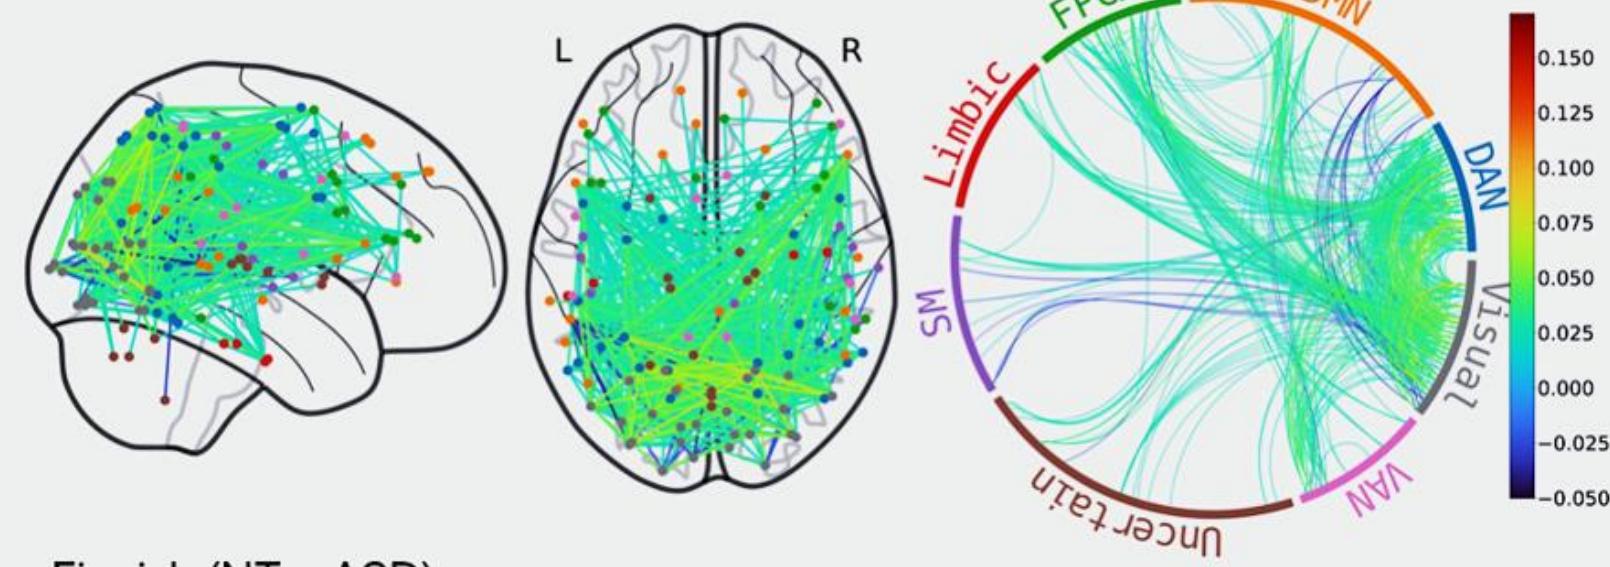

- Traditional analysis:
 - Hypothesis → Model design → GLM → Results
 - "Let's turn the analysis upside down"
 - Find new hypotheses
 1. Measure dynamic brain synchronization (time-window ISC/ISPS)
 2. Identify time points with high synchrony
 3. Figure out what is happening in the stimulus at the time of high synchrony
 4. Test new hypothesis in future studies.

Intersubject functional connectivity (ISFC)

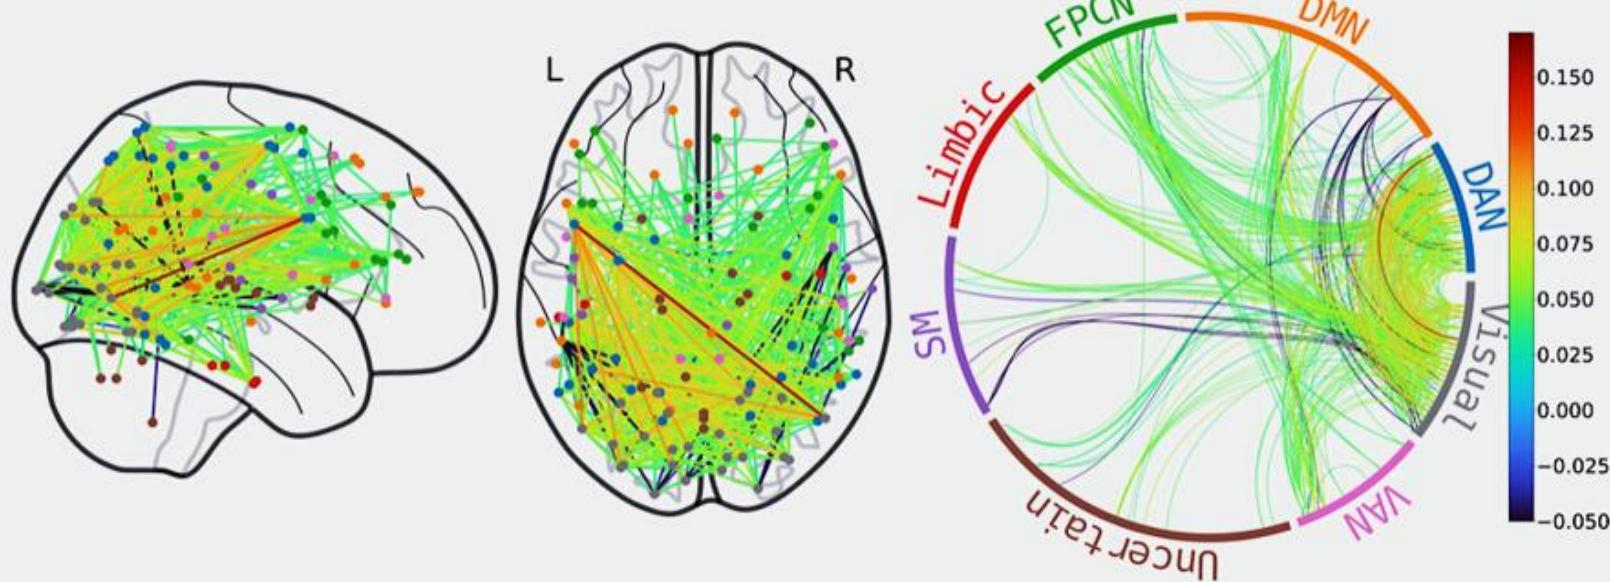

(Nastase, 2019)

German (NT > ASD)

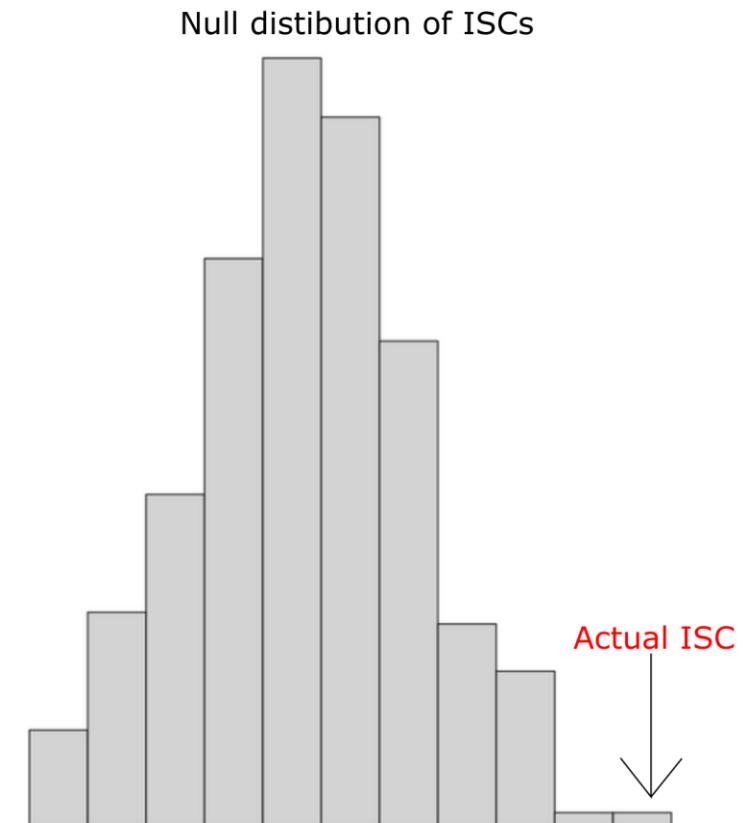

Finnish (NT > ASD)

(Lin, in preparation)

Statistical significance of ISC

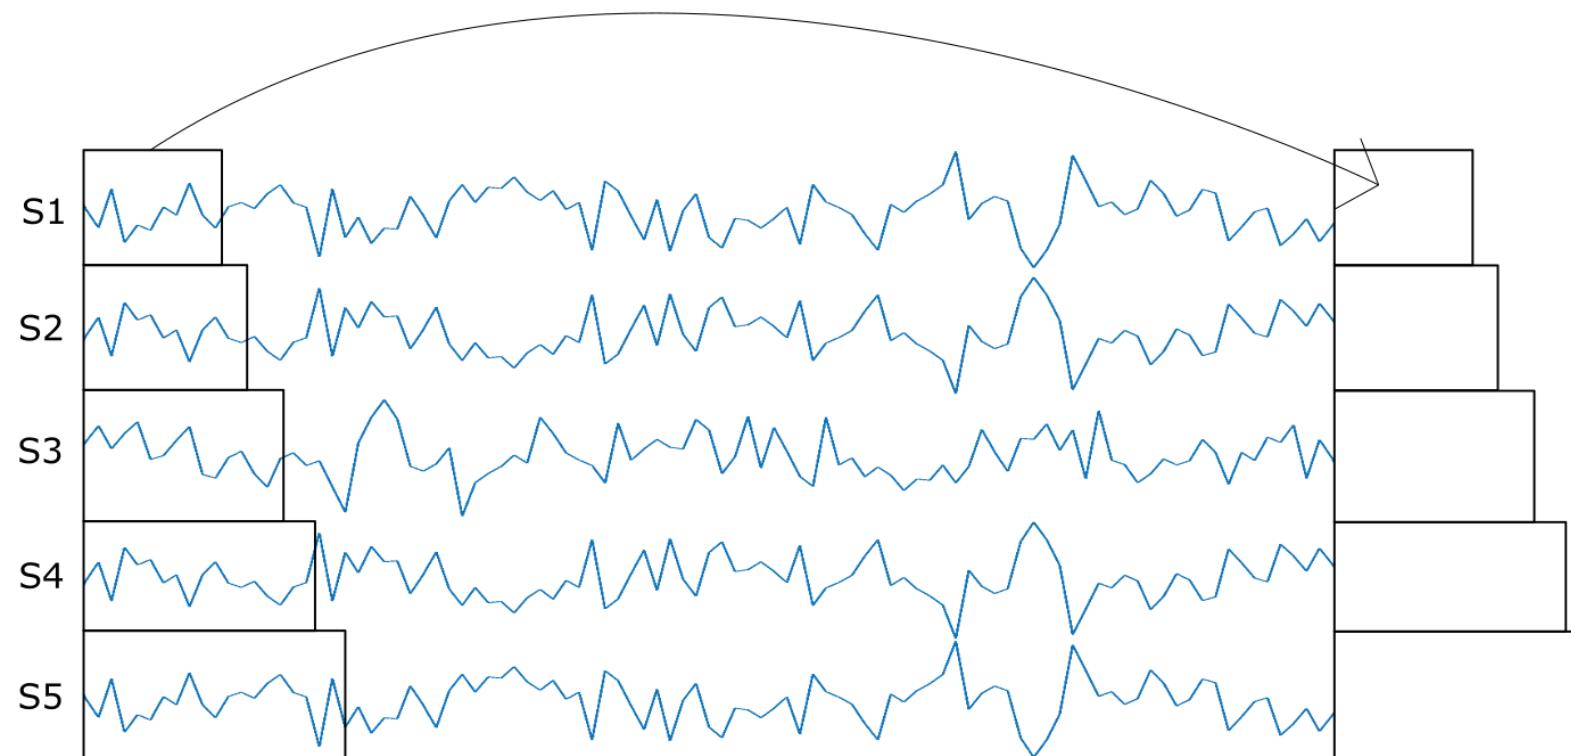

- Does ISC differ statistically from zero?
- Pairwise correlation values are not independent from each other
 - Violates the assumption of independent observations in parametric tests
- Non-parametric permutation based testing
 - Circular block-resampling
- Multiple comparisons correction

(Kauppi, 2010)

Circular block-resampling method

Circular resampling

1. Circular resampling
--> Break the temporal synchrony

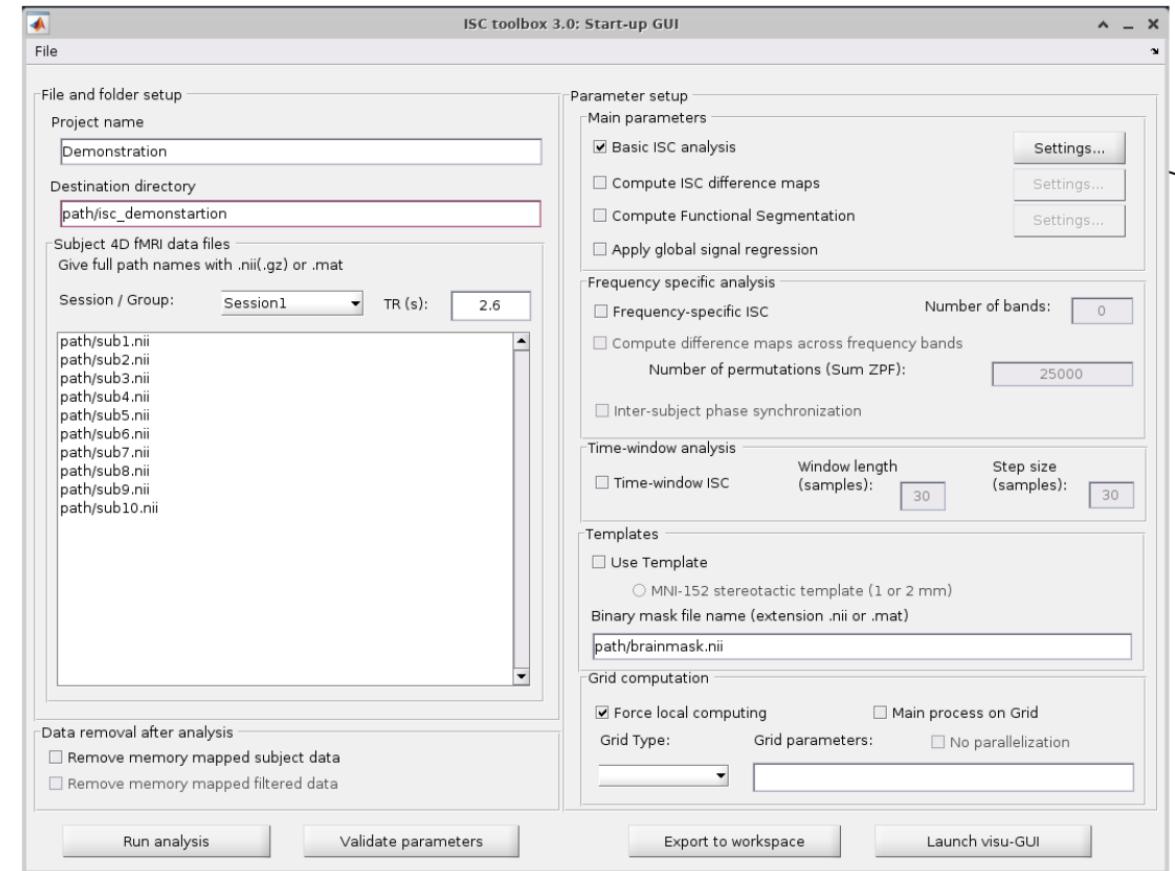

2. Calculate group ISC based on resampled data
--> Chance level ISC estimate

3. Resample many times (millions)
--> Null distribution of ISC values

4. Rank actual ISC value in the null distribution
-->p-value

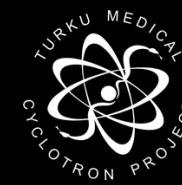

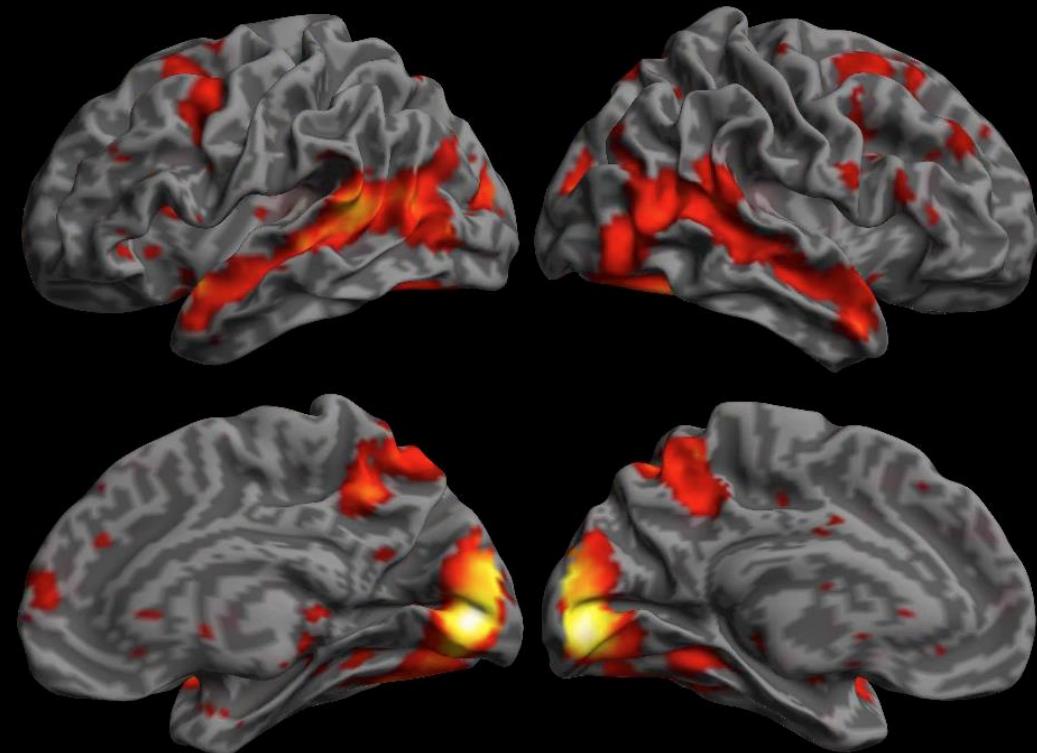

ISC-toolbox

- ISC analysis toolbox for brain fMRI data.
 - <https://www.nitrc.org/projects/isc-toolbox/>
 - Graphical user interface
- Runs on MATLAB
- Features
 - Basic one group analysis
 - Group comparison analysis
 - e.g. patients vs. healthy controls
 - Frequency specific ISC analysis (advanced)
 - Time-window ISC / ISPS
 - Permutations based statistics

(Kauppi, 2014)

Thank you!
